

# **Ixef® DW-1022**

## polyarylamide

lxef® DW-1022 is a 50% glass-fiber reinforced, general purpose polyarylamide compound that exhibits very high strength and rigidity, outstanding surface gloss, and excellent creep resistance.

lxef® DW-1022 is approved for use in potable water in France, Germany, the United States and the United Kingdom.

#### **Injection Notes**

Hot runners: 250°C to 260°C (482°C to 500°F)

#### Storage

lxef® compounds are shipped in moisture-resistant packages at moisture levels according to specifications. Sealed, undamaged bags should be preferably stored in a dry room at a maximum temperature of 50°C (122°F) and should be protected from possible damage. If only a portion of a package is used, the remaining material should be transferred into a sealable container. It is recommended that lxef® resins be dried prior to molding following the recommendations found in this datasheet and/or in the lxef® processing guide.

#### Drying

The material as supplied is ready for molding without drying. However, If the bags have been open for longer than 24 hours, the material needs to be dried. When using a desiccant air dryer with dew point of -28°C (-18°F) or lower, these guidelines can be followed: 0.5-1.5 hour at 120°C (248°F), 1-3 hours at 100°C (212°F), or 1-7 hours at 80°C (176°F).

#### Injection Molding

lxef® DW-1022 compound can be readily injection molded in most screw injection molding machines. A general purpose screw is recommended, with minimum back pressure.

The measured melt temperature should be about  $280^{\circ}$ C ( $536^{\circ}$ F), and the barrel temperatures should be around 250 to  $260^{\circ}$ C (482 to  $500^{\circ}$ F) in the rear zone, gradually increasing to 260 to  $290^{\circ}$ C (500 to  $554^{\circ}$ F) in the front zone. If hot runners are used, they should be set to 250 to  $260^{\circ}$ C (482 to  $500^{\circ}$ F).

To maximize crystallinity, the temperature of the mold cavity surface must be held between 120 and 140°C (248 and 284°F). Molding at lower temperatures will produce articles that may warp, have poor surface appearance, and have a greater tendency to creep. Set injection pressure to give rapid injection. Adjust holding pressure and hold time to maximize part weight. Transfer from injection to hold pressure at the screw position just before the part is completely filled (95-99%).
